

MATH 425

9/28/2022

Note Title

9/28/2022

Test 1 : A week from today in class

50 min exam, 5 questions, each worth 20 pts.  
(can be subdivided into parts). No calculators.

Answers should be expressions  
(unless specified), legible

Topics : on Friday (everything before conditional probability)

On Monday Review.

Accommodations: You need to schedule your exam with TAC. (must start at the same time to get the exact same test)

---

Back to conditional probability

Example: Suppose a person has two children one is a male born on Tuesday. What is the probability they are both male?

at least

Solution:

	1st	Male							
		M	T	W	Th	F	S		
Male	M								
	T								
	W								
	Th								
	F								
	S								
F	M								
	T								
	W								
	Th								
	F								
	S								

$T$ : Conditioning event: at least one is a male born on  $T$

$$P(T) = \frac{14 + 14 - 1}{14^2} =$$

$$= \frac{27}{196}$$

E = both  
males

$E \cap T$

$P$

$P$

$$P(\bar{E} \cap T) =$$

$$= \frac{7+7-1}{14^2} = \frac{13}{196}$$

$$P(E | T) = \frac{P(E \cap T)}{P(T)} = \frac{\frac{13}{196}}{\frac{27}{196}} = \underline{\underline{\frac{13}{27}}}$$

---

Note: Asking: Suppose a person has two children  
at least one is a male. What is the probability the  
other one is a male born on a Tuesday?  
does not make sense. (is ambiguous)

which one?

---

Simplified let's make a deal!

Game show: Two doors are on stage and

behind them, two prizes are randomly placed. The contestant points at one door, if there is at least one prize behind it, it is revealed and then removed. (This is the practice round.)

In the second round, the contestant again chooses a door. Again, if a prize is left behind that door, it is revealed and this time, the contestant gets to keep it. What is the right strategy?

Solution:

If there is a purse behind D1  
conditioning event

$$P(F) = \frac{3}{4}.$$

The first door  
should be chosen  
randomly, eg D1.

If no purse is  
revealed i.e.  
1st round, choose  
D2 - certain win

$E$  = both prizes behind Door 1:  $E \subset F$

$$P(E \cap F) = P(\bar{E}) = \frac{1}{4}$$

$$P(E|F) = \frac{1/4}{3/4} = \underline{\underline{\frac{1}{3}}}$$

Correct strategy: choose the other door in  
Round 2 no matter what

$$P(E^c|F) = 1 - P(E|F) = 1 - \frac{1}{3} = \underline{\underline{\frac{2}{3}}}$$

---

Follow-up: 3 doors.

If there was a prize behind D1:

$P_1 \backslash P_2$	D1	D2	D3
D1	✓	✓	✓
D2	✓		
D3	✓		

Conditioning event:  $\bar{P}$

First round No prize  
 $\Rightarrow$  choose <sup>of the</sup> other doors

Chance of winning:  $\boxed{\frac{3}{4}}$

$P_1 \backslash P_2$	D2	D3
D2	✓	✓
D3	✓	

choose door 2

Ⓟ

(there was a prize behind door 1)

$$P(F) = \frac{5}{9}$$

Probability that both prizes behind door 1 :  $P(\bar{E}) = \frac{1}{9}$

$$\bar{E} \subset F$$

$$P(E|F) = \frac{P(\bar{E})}{P(F)} = \frac{P(\bar{E} \cap F)}{P(F)} = \frac{1/9}{5/9} = \frac{1}{5}$$

$$P(E^c) = \frac{4}{5}$$

Choose, say D2

By symmetry:  $P(\text{winning}) = \frac{2}{5}$ .

Strategy: Choose another door (no matter what)

What are our chances of winning the game overall using this strategy?

$$P(G) = \frac{4}{9}$$

no prize behind  
D1

P1 \ P2			
	D1	D2	D3
D1			
D2			
D3			

$$\underbrace{\left( \frac{4}{9} \right) \cdot \frac{3}{4} + \left( \frac{5}{9} \right) \cdot \frac{2}{5}}_{\text{Bayes formula}} = \frac{3}{9} + \frac{2}{9} = \underline{\underline{\frac{5}{9}}}$$

$P(G)$       $\otimes$       $P(G^c)$

Bayes formula ← add up conditional probabilities over a complete system of disjoint conditions to get total probability.

HW

- ③ Suppose a person has two children and at least one of them is a male born on M or Tuesday. (a) What is the probability the other one is a female?
- ⑥ What is the probability the other one is a female born on a Thursday?

- ④ Discuss "let's make a deal" with 4 doors. Assuming I choose another door in Round 2.
- (a) What are my chances of winning if no prize was revealed in Round 1?
  - (b) What are my chances of winning if there was a prize revealed in Round 1?
  - (c) What are my overall chances of winning?
